

Dataset “Predict students' dropout and academic success”

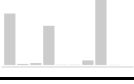

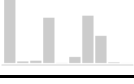

The dataset includes information known at the time of student enrollment (academic path, demographics, and Macro-economics and Socio-economics factors) and the student's academic performance at the end of the first and second semesters.

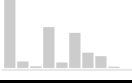

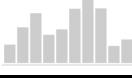

The data is used to build classification models to predict students' dropout and academic success.

The problem is formulated as a three-category classification task (dropout, enrolled, and graduate) at the end of the normal duration of the course.

The dataset contained 4,424 records (without missing values) and with 35 variables, where each record represents an individual student.

Move the mouse over the name of the variable to get description of possible values.
